(Revised)

RE: UMA SOC Ph II Env. Investigation

Dear Kelly Nepl:

Braun Intertec Corporation received samples for the project identified above on June 08, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a “story” about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini “case narrative” that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each “cooler” is identified and the conditions associated with that cooler are documented. A “cooler” is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be “Total Petroleum Hydrocarbons.” Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an “M” (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word “dry” will appear next to the units. If the word “dry” does not appear then the result is “as received.”

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up as bolded. They are considered “hits.” The MDL is a statistically derived number that indicates, with high confidence, that an analyte can be detected above noise level. If a result is less than this value it is marked as “ND” for “Non-Detect.” If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a “J” flag denoting that it has been detected but that the result is an estimate. This is consistent with the *CLP Statement of Work* and the *National Functional Guidelines*.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

Qualifiers and Abbreviations

vn	The surrogate recovery is below the laboratory generated control limits.
qo	The relative percent difference (RPD) was outside of laboratory control limits for the matrix spike (MS) and matrix spike duplicate (MSD) samples.
qn	The spike recovery is outside of laboratory control limits for the matrix spike (MS) and/or the matrix spike duplicate (MSD).
J	Detected but below the Method Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
gw	The sample was extracted 1Day past the method specified holding time.
COC	Chain of Custody
dry	Sample results reported on a dry weight basis
MDL	Method Detection Limit
MRL	Method Reporting Limit
NA	Not Applicable
ND	Analyte NOT DETECTED
NR	Not Reported
%Rec	Percent Recovery
RPD	Relative Percent Difference
VOC	Volatile Organic Compound

Case Narrative

The list 2 analyses for this work order was reextracted due to equipment failure in the extraction apparatus. Samples -01 and -02 were one day past the recommended holding when reextracted.

(Revised)

RE: UMA SOC Ph II Env. Investigation

Dear James Aiken:

Braun Intertec Corporation received samples for the project identified above on June 08, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a "story" about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini "case narrative" that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each "cooler" is identified and the conditions associated with that cooler are documented. A "cooler" is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be "Total Petroleum Hydrocarbons." Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an "M" (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word "dry" will appear next to the units. If the word "dry" does not appear then the result is "as received."

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up as bolded. They are considered "hits." The MDL is a statistically derived number that indicates, with high confidence, that an analyte can be detected above noise level. If a result is less than this value it is marked as "ND" for "Non-Detect." If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a "J" flag denoting that it has been detected but that the result is an estimate. This is consistent with the *CLP Statement of Work* and the *National Functional Guidelines*.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

Case Narrative

The laboratory control sample duplicate (LCSD) for the List 1 Pesticides water analysis (B9F0203-BSD1) did not extract/concentrate properly and is not representative of the batch. The results for the LCSD were not reported. The laboratory control sample LCS was within normal limits and is reported.

(Revised)

RE: UMore Phase II

Dear Kelly Nepl:

Braun Intertec Corporation received samples for the project identified above on June 10, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a "story" about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini "case narrative" that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each "cooler" is identified and the conditions associated with that cooler are documented. A "cooler" is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be "Total Petroleum Hydrocarbons." Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an "M" (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word "dry" will appear next to the units. If the word "dry" does not appear then the result is "as received."

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up as bolded. They are considered "hits." The MDL is a statistically derived number that indicates, with high confidence, that an analyte can be detected above noise level. If a result is less than this value it is marked as "ND" for "Non-Detect." If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a "J" flag denoting that it has been detected but that the result is an estimate. This is consistent with the *CLP Statement of Work* and the *National Functional Guidelines*.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

Qualifiers and Abbreviations

vn	The surrogate recovery is below the laboratory generated control limits.
vm	The surrogate recovery is above the laboratory generated control limits.
sur	One or more surrogate recoveries reported with this sample analysis are outside of the laboratory control limits.
qo	The relative percent difference (RPD) was outside of laboratory control limits for the matrix spike (MS) and matrix spike duplicate (MSD) samples.
qn	The spike recovery is outside of laboratory control limits for the matrix spike (MS) and/or the matrix spike duplicate (MSD).
go	The laboratory control sample recovery is outside of laboratory control limits.
COC	Chain of Custody
dry	Sample results reported on a dry weight basis
MDL	Method Detection Limit
MRL	Method Reporting Limit
NA	Not Applicable
ND	Analyte NOT DETECTED
NR	Not Reported
%Rec	Percent Recovery
RPD	Relative Percent Difference
VOC	Volatile Organic Compound

(Revised)

RE: 23/19-B05.07 SOC350

Dear Kelly Nepl:

Braun Intertec Corporation received samples for the project identified above on June 11, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a “story” about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini “case narrative” that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each “cooler” is identified and the conditions associated with that cooler are documented. A “cooler” is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be “Total Petroleum Hydrocarbons.” Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an “M” (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word “dry” will appear next to the units. If the word “dry” does not appear then the result is “as received.”

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up as bolded. They are considered “hits.” The MDL is a statistically derived number that indicates, with high confidence, that an analyte can be detected above noise level. If a result is less than this value it is marked as “ND” for “Non-Detect.” If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a “J” flag denoting that it has been detected but that the result is an estimate. This is consistent with the *CLP Statement of Work* and the *National Functional Guidelines*.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

Qualifiers and Abbreviations

sd	See case narrative section for further information.
qo	The relative percent difference (RPD) was outside of laboratory control limits for the matrix spike (MS) and matrix spike duplicate (MSD) samples.
qn	The spike recovery is outside of laboratory control limits for the matrix spike (MS) and/or the matrix spike duplicate (MSD).
J	Detected but below the Method Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
gw	The sample was extracted 1 day past the method specified holding time.
gp	The relative percent difference (RPD) for the laboratory control sample and laboratory control sample duplicate is outside of laboratory control limits.
go	The laboratory control sample recovery is outside of laboratory control limits.
COC	Chain of Custody
dry	Sample results reported on a dry weight basis
MDL	Method Detection Limit
MRL	Method Reporting Limit
NA	Not Applicable
ND	Analyte NOT DETECTED
NR	Not Reported
%Rec	Percent Recovery
RPD	Relative Percent Difference
VOC	Volatile Organic Compound

Case Narrative

Sample SOC3-GP3 was received 6-12-09 with a different work order.

The list 1 analyses for this work order was reextracted due to equipment failure in the extraction apparatus. Samples -01 and -03 were one day past the recommended holding when reextracted.

One of the laboratory control samples for List 1 was inadvertently spiked with double the normal amount standard. The recoveries reported are corrected but the relative per cent difference can't be reported for that batch. The recoveries of all of the compounds for the laboratory control sample and laboratory control sample duplicate were within limits.

(Revised)

RE: UMore PH2

Dear Kelly Nepl:

Braun Intertec Corporation received samples for the project identified above on June 11, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a "story" about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini "case narrative" that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each "cooler" is identified and the conditions associated with that cooler are documented. A "cooler" is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be "Total Petroleum Hydrocarbons." Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an "M" (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word "dry" will appear next to the units. If the word "dry" does not appear then the result is "as received."

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up as bolded. They are considered "hits." The MDL is a statistically derived number that indicates, with high confidence, that an analyte can be detected above noise level. If a result is less than this value it is marked as "ND" for "Non-Detect." If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a "J" flag denoting that it has been detected but that the result is an estimate. This is consistent with the *CLP Statement of Work* and the *National Functional Guidelines*.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

Qualifiers and Abbreviations

vn	The surrogate recovery is below the laboratory generated control limits.
sur	One or more surrogate recoveries reported with this sample analysis are outside of the laboratory control limits.
sd	See case narrative section for further information.
qn	The spike recovery is outside of laboratory control limits for the matrix spike (MS) and/or the matrix spike duplicate (MSD).
COC	Chain of Custody
dry	Sample results reported on a dry weight basis
MDL	Method Detection Limit
MRL	Method Reporting Limit
NA	Not Applicable
ND	Analyte NOT DETECTED
NR	Not Reported
%Rec	Percent Recovery
RPD	Relative Percent Difference
VOC	Volatile Organic Compound

Case Narrative

One of the laboratory control samples for List 1 was inadvertently spiked with double the normal amount standard. The recoveries reported are corrected but the relative per cent difference can't be reported for that batch. The recoveries of all of the compounds for the laboratory control sample and laboratory control sample duplicate were within limits.

(Revised)

RE: UMore Park

Dear Kelly Nepl:

Braun Intertec Corporation received samples for the project identified above on June 12, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a “story” about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini “case narrative” that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each “cooler” is identified and the conditions associated with that cooler are documented. A “cooler” is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be “Total Petroleum Hydrocarbons.” Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an “M” (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word “dry” will appear next to the units. If the word “dry” does not appear then the result is “as received.”

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up as bolded. They are considered “hits.” The MDL is a statistically derived number that indicates, with high confidence, that an analyte can be detected above noise level. If a result is less than this value it is marked as “ND” for “Non-Detect.” If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a “J” flag denoting that it has been detected but that the result is an estimate. This is consistent with the *CLP Statement of Work* and the *National Functional Guidelines*.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

Qualifiers and Abbreviations

vn	The surrogate recovery is below the laboratory generated control limits.
vfa	The method reporting limit (MRL) was raised for one or more analytes; a dilution of the sample was necessary due to high analyte levels and/or matrix interferences.
sur	One or more surrogate recoveries reported with this sample analysis are outside of the laboratory control limits.
sd	See case narrative section for further information.
qo	The relative percent difference (RPD) was outside of laboratory control limits for the matrix spike (MS) and matrix spike duplicate (MSD) samples.
qn	The spike recovery is outside of laboratory control limits for the matrix spike (MS) and/or the matrix spike duplicate (MSD).
J	Detected but below the Method Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
gp	The relative percent difference (RPD) for the laboratory control sample and laboratory control sample duplicate is outside of laboratory control limits.
go	The laboratory control sample recovery is outside of laboratory control limits.
COC	Chain of Custody
dry	Sample results reported on a dry weight basis
MDL	Method Detection Limit
MRL	Method Reporting Limit
NA	Not Applicable
ND	Analyte NOT DETECTED
NR	Not Reported
%Rec	Percent Recovery
RPD	Relative Percent Difference
VOC	Volatile Organic Compound

Case Narrative

One of the laboratory control samples for List 1 was inadvertently spiked with double the normal amount standard. The recoveries reported are corrected but the relative per cent difference can't be reported for that batch. The recoveries of all of the compounds for both the laboratory control sample and laboratory control sample duplicate were within limits.

(Revised)

RE: [none]

Dear Kelly Nepl:

Braun Intertec Corporation received samples for the project identified above on June 12, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a “story” about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini “case narrative” that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each “cooler” is identified and the conditions associated with that cooler are documented. A “cooler” is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be “Total Petroleum Hydrocarbons.” Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an “M” (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word “dry” will appear next to the units. If the word “dry” does not appear then the result is “as received.”

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up as bolded. They are considered “hits.” The MDL is a statistically derived number that indicates, with high confidence, that an analyte can be detected above noise level. If a result is less than this value it is marked as “ND” for “Non-Detect.” If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a “J” flag denoting that it has been detected but that the result is an estimate. This is consistent with the *CLP Statement of Work* and the *National Functional Guidelines*.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

Qualifiers and Abbreviations

vn	The surrogate recovery is below the laboratory generated control limits.
sur	One or more surrogate recoveries reported with this sample analysis are outside of the laboratory control limits.
qo	The relative percent difference (RPD) was outside of laboratory control limits for the matrix spike (MS) and matrix spike duplicate (MSD) samples.
J	Detected but below the Method Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
gp	The relative percent difference (RPD) for the laboratory control sample and laboratory control sample duplicate is outside of laboratory control limits.
go	The laboratory control sample recovery is outside of laboratory control limits.
COC	Chain of Custody
dry	Sample results reported on a dry weight basis
MDL	Method Detection Limit
MRL	Method Reporting Limit
NA	Not Applicable
ND	Analyte NOT DETECTED
NR	Not Reported
%Rec	Percent Recovery
RPD	Relative Percent Difference
VOC	Volatile Organic Compound

Work Order #: 0902951
(Revised)

RE: 23/19-0B05 SOC 300

Dear Kelly Nepl:

Braun Intertec Corporation received samples for the project identified above on June 12, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a “story” about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini “case narrative” that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each “cooler” is identified and the conditions associated with that cooler are documented. A “cooler” is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be “Total Petroleum Hydrocarbons.” Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an “M” (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word “dry” will appear next to the units. If the word “dry” does not appear then the result is “as received.”

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up as bolded. They are considered “hits.” The MDL is a statistically derived number that indicates, with high confidence, that an analyte can be detected above noise level. If a result is less than this value it is marked as “ND” for “Non-Detect.” If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a “J” flag denoting that it has been detected but that the result is an estimate. This is consistent with the *CLP Statement of Work* and the *National Functional Guidelines*.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

Qualifiers and Abbreviations

qo	The relative percent difference (RPD) was outside of laboratory control limits for the matrix spike (MS) and matrix spike duplicate (MSD) samples.
J	Detected but below the Method Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
gp	The relative percent difference (RPD) for the laboratory control sample and laboratory control sample duplicate is outside of laboratory control limits.
go	The laboratory control sample recovery is outside of laboratory control limits.
COC	Chain of Custody
dry	Sample results reported on a dry weight basis
MDL	Method Detection Limit
MRL	Method Reporting Limit
NA	Not Applicable
ND	Analyte NOT DETECTED
NR	Not Reported
%Rec	Percent Recovery
RPD	Relative Percent Difference
VOC	Volatile Organic Compound

(Revised)

RE: UMore Phase 2

Dear Kelly Nepl:

Braun Intertec Corporation received samples for the project identified above on June 17, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a "story" about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini "case narrative" that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each "cooler" is identified and the conditions associated with that cooler are documented. A "cooler" is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be "Total Petroleum Hydrocarbons." Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an "M" (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word "dry" will appear next to the units. If the word "dry" does not appear then the result is "as received."

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up as bolded. They are considered "hits." The MDL is a statistically derived number that indicates, with high confidence, that an analyte can be detected above noise level. If a result is less than this value it is marked as "ND" for "Non-Detect." If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a "J" flag denoting that it has been detected but that the result is an estimate. This is consistent with the *CLP Statement of Work* and the *National Functional Guidelines*.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

RE: UMore UMA-SSI/RI 23/19-B05.07 SOC 325

Dear Kelly Neopl:

Braun Intertec Corporation received samples for the project identified above on September 21, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a "story" about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini "case narrative" that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each "cooler" is identified and the conditions associated with that cooler are documented. A "cooler" is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be "Total Petroleum Hydrocarbons." Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an "M" (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word "dry" will appear next to the units. If the word "dry" does not appear then the result is "as received."

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up in bold. They are considered "hits." The MDL is a statistically derived number that indicates an estimated concentration at which an analyte can be detected above the noise level. If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a "J" flag denoting that it has been detected but that the result is an estimate.

In this specific report format, the majority of the analyses are reported without estimated concentrations less than the MRL. For these analyses, if a result is less than the MRL, the result is given as less than the MRL (e.g. if the MRL = 10 then a less than result would be given as "<10"). However, for the Organochlorine Pesticides in water and MDA List 1 Pesticides in water analyses, if a result is less than the MRL but greater than the MDL, then an estimated result is reported with a "J" flag. If a result for either of these two analyses is less than the MDL, then the result is given as less than the MDL.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

RE: UMore UMA-SSI/RI 23/19-B05.07 SIRI 300

Dear Kelly Neppl:

Braun Intertec Corporation received samples for the project identified above on September 30, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a "story" about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini "case narrative" that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each "cooler" is identified and the conditions associated with that cooler are documented. A "cooler" is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be "Total Petroleum Hydrocarbons." Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an "M" (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word "dry" will appear next to the units. If the word "dry" does not appear then the result is "as received."

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up in bold. They are considered "hits." The MDL is a statistically derived number that indicates an estimated concentration at which an analyte can be detected above the noise level. If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a "J" flag denoting that it has been detected but that the result is an estimate.

In this specific report format, the majority of the analyses are reported without estimated concentrations less than the MRL. For these analyses, if a result is less than the MRL, the result is given as less than the MRL (e.g. if the MRL = 10 then a less than result would be given as "<10"). However, for the Organochlorine Pesticides in water and MDA List 1 Pesticides in water analyses, if a result is less than the MRL but greater than the MDL, then an estimated result is reported with a "J" flag. If a result for either of these two analyses is less than the MDL, then the result is given as less than the MDL.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

Qualifiers and Abbreviations

qn	The spike recovery is outside of laboratory control limits for the matrix spike (MS) and/or the matrix spike duplicate (MSD).
J	Detected but below the Method Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
gp	The relative percent difference (RPD) for the laboratory control sample and laboratory control sample duplicate is outside of laboratory control limits.
go	The laboratory control sample recovery is outside of laboratory control limits.
COC	Chain of Custody
dry	Sample results reported on a dry weight basis
MDL	Method Detection Limit
MRL	Method Reporting Limit
NA	Not Applicable
ND	Analyte NOT DETECTED
NR	Not Reported
%Rec	Percent Recovery
RPD	Relative Percent Difference
VOC	Volatile Organic Compound

RE: UMore UMA-SSI/RI 23/19-B05.07 SIRI 300

Dear Kelly Neppl:

Braun Intertec Corporation received samples for the project identified above on September 30, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a "story" about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini "case narrative" that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each "cooler" is identified and the conditions associated with that cooler are documented. A "cooler" is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be "Total Petroleum Hydrocarbons." Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an "M" (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word "dry" will appear next to the units. If the word "dry" does not appear then the result is "as received."

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up in bold. They are considered "hits." The MDL is a statistically derived number that indicates an estimated concentration at which an analyte can be detected above the noise level. If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a "J" flag denoting that it has been detected but that the result is an estimate.

In this specific report format, the majority of the analyses are reported without estimated concentrations less than the MRL. For these analyses, if a result is less than the MRL, the result is given as less than the MRL (e.g. if the MRL = 10 then a less than result would be given as "<10"). However, for the Organochlorine Pesticides in water and MDA List 1 Pesticides in water analyses, if a result is less than the MRL but greater than the MDL, then an estimated result is reported with a "J" flag. If a result for either of these two analyses is less than the MDL, then the result is given as less than the MDL.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

RE: UMore UMA-SSI/RI 23/19-0B05 SOC 325

Dear Kelly Neppl:

Braun Intertec Corporation received samples for the project identified above on October 02, 2009. Analytical results are summarized in the following report.

All routine quality assurance procedures were followed, unless otherwise noted.

Analytical results are reported on an "as received" basis unless otherwise noted. Where possible, the samples will be retained by the laboratory for 14 days following issuance of the initial final report. The samples will be disposed of or returned at that time. Arrangements can be made for extended storage by contacting me at this time.

We appreciate your decision to use Braun Intertec Corporation for this project. We are committed to being your vendor of choice to meet your analytical chemistry needs.

If you have any questions please contact me at the above phone number.

Sincerely,

Steven J. Albrecht
Associate Principal

How to Use this Report

In order to get the most out of the information presented in this report please refer to the following explanations as to how the data in this report is tied together and how some of the terms are defined.

Qualifiers and Abbreviations are defined in the following section. You will find these codes used throughout the report in headers and in note sections to designate a unique fact about the data to which they are associated.

The Case Narrative gives a "story" about the analysis and results. Here you will find greater elaboration on relevant qualifiers as well as an explanation of anything of particular note in the data. This is a discussion of the data in terms of quality control and chemistry. It is a summary of any deviations that could affect the usefulness of the data. This is not an interpretation as to how this information relates to regulatory compliance, toxicity, or hazardous characterization. These items are beyond the scope of this report.

The Sample Summary provides detail on sample receipt. The association between Client sample ID and the Laboratory sample ID are defined here; this information is valuable to have when discussing results with your project manager. Sample collection and receipt dates and times are provided here as well. General notes regarding the work order are also documented here. This is a mini "case narrative" that describes any anomalies regarding the condition of the samples upon arrival to the laboratory or special circumstances regarding the work order.

The Conditions Upon Receipt summarizes the results of specific checks that have been performed at sample receipt. This includes items like custody documentation, sample condition, and temperature at receipt. Each "cooler" is identified and the conditions associated with that cooler are documented. A "cooler" is defined as the larger container used to transport the individual samples. In most cases this is a standard recreational cooler but it can be a box, plastic bag, or other container.

The laboratory results are summarized in the following sections. Data is broken down into major categories for convenience. An example of such a category would be "Total Petroleum Hydrocarbons." Here you would find data that references the testing of such parameters as diesel range organics and gasoline range organics. Other categories are similarly mapped. The batch number is associated with each sample. This is important to evaluate Quality Control (QC) data. Surrogate results samples are provided with each sample. Laboratory control limits are provided for comparison (see below). The reference method is also identified. If a method is denoted with an "M" (e.g. EPA 1234(M)) this means that it has been modified. An explanation of the modification will be found in the Case Narrative. A result is given with appropriate units. If a soil sample is dry-weight corrected then the word "dry" will appear next to the units. If the word "dry" does not appear then the result is "as received."

The Method Reporting Limit (MRL) and Method Detection Limit (MDL) are provided. It is important to understand these terms. The MRL is a level that has been empirically verified to provide reliable quantitation of results. Results that are equal to or greater than this value will show up in bold. They are considered "hits." The MDL is a statistically derived number that indicates an estimated concentration at which an analyte can be detected above the noise level. If a result is less than the MRL but greater than the MDL then it is considered an estimate. Such a result is reported with a "J" flag denoting that it has been detected but that the result is an estimate.

In this specific report format, the majority of the analyses are reported without estimated concentrations less than the MRL. For these analyses, if a result is less than the MRL, the result is given as less than the MRL (e.g. if the MRL = 10 then a less than result would be given as "<10"). However, for the Organochlorine Pesticides in water and MDA List 1 Pesticides in water analyses, if a result is less than the MRL but greater than the MDL, then an estimated result is reported with a "J" flag. If a result for either of these two analyses is less than the MDL, then the result is given as less than the MDL.

The Quality Control (QC) samples are documented in the following section. Here you will find the preparation batches associated with each sample from the results section. The sample preparation method is also defined here. Accuracy is represented here in terms of a percent recovery as compared to a known value. Precision is represented as a relative percent difference between two duplicate sample aliquots. The laboratory control limits are provided as a means to evaluate the quality control data. If the result falls outside the laboratory control limits this simply means that it is outside what is typical for the laboratory and is noted accordingly. This does not mean that the data is invalid. Laboratory control limits are generally tighter than most program limits. This is a very important distinction. How the data is ultimately used determines its validity. Program requirements are defined in the Quality Assurance Project Plan (QAPP) governing the project. If your project manager is aware of your specific program requirements then a note will be made in the case narrative if the data fails to meet any of these requirements.

The last section contains copies of important documents and/or instrument printouts relevant to the report. This includes the chain of custody. It also may include items like chromatograms or spectra.

Please note that this report is paginated and must be reproduced in its entirety.

Work Order Number: 0902716
RE: 23/19-0B05.07

Enclosed are the results of analyses for samples received by the laboratory on 06/05/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of this report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

REVISION

Ms. Kelly Neppl
Barr Engineering Co.
4700 W 77th St
Minneapolis, MN 55435

Work Order Number: 0902742
RE: 23/19-0B05.07

This is a revised report. The details of the revision are listed in the case narrative on the following page.

Enclosed are the results of analyses for samples received by the laboratory on 06/05/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of the original report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

ANALYTICAL REPORT FOR SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
SOC2-TT1-1.5'	0902742-01	Soil	06/05/09 09:00	06/05/09 16:15
SOC2-TT2-0.5'-1.5'	0902742-02	Soil	06/05/09 10:45	06/05/09 16:15
SOC2-TT3-0.5'-1'	0902742-03	Soil	06/05/09 11:45	06/05/09 16:15
SOC2-TT4-0.5'-1'	0902742-04	Soil	06/05/09 13:30	06/05/09 16:15
SOC2-TT5-0.5'-1'	0902742-05	Soil	06/05/09 14:30	06/05/09 16:15

Shipping Container Information

Default Cooler Temperature (°C): 9.6

Received on ice: Yes Temperature blank was present Received on ice pack: No
 Received on melt water: No Ambient: No Acceptable (IH/ISO only): No
 Custody seals: No

Case Narrative:

Recoveries for the 8270 SVOC compounds 1,2,4-trichlorobenzene in the batch B9F1109 MS and pentachlorophenol in the MSD were above laboratory limits. All spike compounds and surrogates were within limits in the batch method blank and LCS. The MS/MSD source sample was not associated with this work order.

This report was revised on 7/28/09 to correct the ICP lead results for samples SOC2-TT2-0.5'-1.5' and SOC2-TT3-0.5'-1'.

Notes and Definitions

- M1 Matrix spike recovery was high, the associated blank spike recovery was acceptable.
- J Parameter was present between the MDL and RL and should be considered an estimated value
- < Less than value listed
- dry Sample results reported on a dry weight basis
- NA Not applicable. The %RPD is not calculated from values less than the reporting limit.
- MDL Method Detection Limit
- RL Reporting Limit
- RPD Relative Percent Difference
- LCS Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
- MS Matrix Spike = Laboratory Fortified Matrix (LFM)

REVISION

Ms. Kelly Neppi
Barr Engineering Co.
4700 W 77th St
Minneapolis, MN 55435

Work Order Number: 0902751
RE: 23/19-0B05.07

This is a revised report. The details of the revision are listed in the case narrative on the following page.

Enclosed are the results of analyses for samples received by the laboratory on 06/09/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of the original report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

Shipping Container Information

Default Cooler Temperature (°C): 5.7

Received on ice: Yes Temperature blank was present Received on ice pack: No
 Received on melt water: No Ambient: No Acceptable (IH/ISO only): No
 Custody seals: No

Case Narrative:

This report contains data that were produced by a subcontracted laboratory certified for the fields of testing performed. The total kjeldahl as N and nitrate/nitrite as N analyses for the Clean Water Program were performed by Davy Laboratories, LaCrosse, WI, #055-999-151.

Recovery for vinyl chloride in the batch B9F1105 MS/MSD was above 8260 laboratory limits but within limits in the LCS. The MS/MSD source sample was SOC1-GP1.

Recoveries for the 8270 SVOC compounds 1,4-dichlorobenzene in the batch B9F1505 MS/MSD and 2,4-dinitrotoluene, benzo[a] pyrene, and anthracene in the MSD were below laboratory limits. All spike compounds and surrogates were within limits in the batch method blank and LCS. The MS/MSD source sample was not associated with this work order.

Recovery for the 8081A surrogate decachlorobiphenyl was below the laboratory limit in the water sample SOC6-GP6. All spike compounds and surrogate recoveries in the 8081A batch B9F1507 blank, LCS/LCSD, and MS were acceptable.

An LCS/LCSD/MS were prepared and analyzed for 8081A batch B9F1507 instead of the method specified LCS/MS/MSD. Insufficient sample was received to meet method QC requirements.

Beryllium recoveries in the MS/MSD samples for batch B9F2215 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was sample SOC1-GP1.

This report was revised on 7/28/09 to correct the ICP lead results for samples SOC1-GP1, 0-4, SOC1-GP2, 0-4, and SOC3-GP3.

Notes and Definitions

- S-GC Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate(s).
- QM-10 LCS/LCSD were analyzed in place of MS/MSD.
- Q9 Insufficient sample received to meet method QC requirements.
- M2 Matrix spike recovery was low, the associated blank spike recovery was acceptable.
- M1 Matrix spike recovery was high, the associated blank spike recovery was acceptable.
- J Parameter was present between the MDL and RL and should be considered an estimated value
- F-01 The sample was filtered in the laboratory prior to analysis.
- < Less than value listed
- dry Sample results reported on a dry weight basis
- NA Not applicable. The %RPD is not calculated from values less than the reporting limit.
- MDL Method Detection Limit
- RL Reporting Limit
- RPD Relative Percent Difference
- LCS Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
- MS Matrix Spike = Laboratory Fortified Matrix (LFM)

Form containing project details, sample collection table, and analytical results. Includes handwritten notes like 'OC Pesticides' and 'Metals samples utilized + un preserved!!'. Table columns include Sample Identification, Date, Time, Matrix, and various chemical parameters.

REVISION

Ms. Kelly Neppi
Barr Engineering Co.
4700 W 77th St
Minneapolis, MN 55435

Work Order Number: 0902757
RE: 23/19-0B05.07

This is a revised report. The details of the revision are listed in the case narrative on the following page.

Enclosed are the results of analyses for samples received by the laboratory on 06/05/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of the original report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

REVISION

Ms. Kelly Neppi
Barr Engineering Co.
4700 W 77th St
Minneapolis, MN 55435

Work Order Number: 0902779
RE: 23/19-0B05.07

This is a revised report. The details of the revision are listed in the case narrative on the following page.

Enclosed are the results of analyses for samples received by the laboratory on 06/10/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of the original report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

Shipping Container Information

Default Cooler Temperature (°C): 4.5

Received on ice: Yes Temperature blank was present Received on ice pack: No
 Received on melt water: No Ambient: No Acceptable (IH/ISO only): No
 Custody seals: No

Case Narrative:

This report contains data that were produced by a subcontracted laboratory certified for the fields of testing performed. The total kjeldahl as N and nitrate/nitrite as N analyses for the Clean Water Program were performed by Davy Laboratories, LaCrosse, WI, #055-999-151.

Recovery for vinyl chloride in the batch B9F1204 MS/MSD was above the 8260 laboratory limits but within limits in the LCS. The MS/MSD source sample was SOC3-GP3.

Recoveries for the 8270 SVOC compounds 1,4-dichlorobenzene in the batch B9F1505 MS/MSD and 2,4-dinitrotoluene, benzo[a] pyrene, and anthracene in the MSD were below laboratory limits. All spike compounds and surrogates were within limits in the batch method blank and LCS. The MS/MSD source sample was not associated with this work order.

An LCS/LCSD were prepared and analyzed for 8081A batch B9F1507 instead of the method specified LCS/MS/MSD. Insufficient sample was received to meet method QC requirements.

Beryllium recoveries in the MS/MSD samples for ICP-MS batch B9F2215 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was not associated with this work order.

This report was revised on 7/28/09 to correct the ICP lead results for samples SOC3-GP2, SOC1-GP3, 0-4, and SOC1-GP3.

Notes and Definitions

- QM-10 LCS/LCSD were analyzed in place of MS/MSD.
- Q9 Insufficient sample received to meet method QC requirements.
- M2 Matrix spike recovery was low, the associated blank spike recovery was acceptable.
- M1 Matrix spike recovery was high, the associated blank spike recovery was acceptable.
- J Parameter was present between the MDL and RL and should be considered an estimated value
- F-01 The sample was filtered in the laboratory prior to analysis.
- < Less than value listed
- dry Sample results reported on a dry weight basis
- NA Not applicable. The %RPD is not calculated from values less than the reporting limit.
- MDL Method Detection Limit
- RL Reporting Limit
- RPD Relative Percent Difference
- LCS Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
- MS Matrix Spike = Laboratory Fortified Matrix (LFM)

REVISION

Ms. Kelly Neppi
Barr Engineering Co.
4700 W 77th St
Minneapolis, MN 55435

Work Order Number: 0902791
RE: 23/19-0B05.07

This is a revised report. The details of the revision are listed in the case narrative on the following page.

Enclosed are the results of analyses for samples received by the laboratory on 06/10/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of the original report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

ANALYTICAL REPORT FOR SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
SOC7-TT7-0.5-1'	0902791-01	Soil	06/08/09 08:30	06/10/09 11:37
SOC7-TT5-0.5-1'	0902791-02	Soil	06/08/09 12:30	06/10/09 11:37

Shipping Container Information

Default Cooler Temperature (°C):

Received on ice: Yes Temperature blank was not present Received on ice pack: No
 Received on melt water: No Ambient: No Acceptable (IH/ISO only): No
 Custody seals: No

Case Narrative:

This report was revised on 7/28/09 to correct the ICP lead results for samples SOC7-TT7-0.5'-1' and SOC7-TT5-0.5'-1'.

Work Order Number: 0902797
RE: 23/19-0B05.07

Enclosed are the results of analyses for samples received by the laboratory on 06/10/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of this report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

Shipping Container Information

Default Cooler

Temperature (°C):

 Received on ice: Yes
 Received on melt water: No
 Custody seals: No

 Temperature blank was not present
 Ambient: No

 Received on ice pack: No
 Acceptable (IH/ISO only): No

Case Narrative:

Recovery for the 8081A surrogate decachlorobiphenyl was below laboratory limit in the soil sample SOC3-TT2-3-4'. All spike compounds and surrogate recoveries in the 8081A batch B9F1515 blank, LCS, and MS/MSD were acceptable.

Recoveries for most of the compounds in the 8270 SVOC batch B9F1801 MS were below laboratory limits. The MS/MSD %RPDs for most of the compounds were outside laboratory limits. Recoveries for the surrogates 2-fluorobiphenyl and 2-fluorophenol in the MS were below laboratory limits. All spike compounds and surrogates were within limits in the batch method blank and LCS/MSD. The MS/MSD source sample was not associated with this work order.

Notes and Definitions

- S-GC Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate(s).
- S-02 Surrogate recovery outside of laboratory acceptance limits.
- R5 MS/MSD RPD exceeded the laboratory acceptance limit. Recovery met acceptance criteria.
- R2 RPD/RSD exceeded the laboratory acceptance limit.
- M2 Matrix spike recovery was low, the associated blank spike recovery was acceptable.
- J Parameter was present between the MDL and RL and should be considered an estimated value
- < Less than value listed
- dry Sample results reported on a dry weight basis
- NA Not applicable. The %RPD is not calculated from values less than the reporting limit.
- MDL Method Detection Limit
- RL Reporting Limit
- RPD Relative Percent Difference
- LCS Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
- MS Matrix Spike = Laboratory Fortified Matrix (LFM)

RE: 23/19-0B05.07

Enclosed are the results of analyses for samples received by the laboratory on 06/12/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of this report and then discarded unless other arrangements are made.

Case Narrative:

This report contains data that were produced by a subcontracted laboratory certified for the fields of testing performed. The total kjeldahl as N and nitrate/nitrite as N analyses for the Clean Water Program were performed by Davy Laboratories, LaCrosse, WI, #055-999-151.

Due to a laboratory extraction error, sample WSW-207605 for the 8270 SVOC and 8081 pesticides analyses were re-sampled by the client. The Legend work order number for the recollected samples is 0902894.

An LCS/LCSD were prepared and analyzed for 8081A batches B9F1507 and B9F1802 instead of the method specified LCS/MS/MSD. Insufficient sample was received to meet method QC requirements.

Recoveries for the 8270 SVOC compounds 4-chloro-3-methylphenol, 4-nitrophenol, and phenol in the batch B9F1702 MS/MSD were below laboratory limits. Recoveries for surrogates 2-fluorophenol, phenol-d6, and 2,4,6-tribromophenol were below laboratory limits in the MS/MSD. All spike compounds and surrogates were within limits in the batch method blank and LCS. The MS/MSD source sample was MW-E2-009.

Beryllium recoveries in the MS/MSD samples for 6020 batch B9F2215 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was not associated with this work order.

Beryllium recoveries in the MS/MSD samples for 6020 batch B9F2412 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was sample WSW-207605.

Silver and zinc recoveries in the MS/MSD samples for 6010 batch B9F2413 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was WSW-207605.

Notes and Definitions

S-02	Surrogate recovery outside of laboratory acceptance limits.
QM-10	LCS/LCSD were analyzed in place of MS/MSD.
Q9	Insufficient sample received to meet method QC requirements.
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
J	Parameter was present between the MDL and RL and should be considered an estimated value
H3b	The trip-blank sample was received and analyzed past holding time.
F-01	The sample was filtered in the laboratory prior to analysis.
<	Less than value listed
dry	Sample results reported on a dry weight basis
NA	Not applicable. The %RPD is not calculated from values less than the reporting limit.
MDL	Method Detection Limit
RL	Reporting Limit
RPD	Relative Percent Difference
LCS	Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
MS	Matrix Spike = Laboratory Fortified Matrix (LFM)

REVISION

Ms. Kelly Neppl
Barr Engineering Co.
4700 W 77th St
Minneapolis, MN 55435

Work Order Number: 0902817
RE: 23/19-0B05.07

This is a revised report. The details of the revision are listed in the case narrative on the following page.

Enclosed are the results of analyses for samples received by the laboratory on 06/12/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of the original report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

Work Order #: 0902817
Date Reported: 08/12/09

Case Narrative:

This report contains data that were produced by a subcontracted laboratory certified for the fields of testing performed. The total kjeldahl as N and nitrate/nitrite as N analyses for the Clean Water Program were performed by Davy Laboratories, LaCrosse, WI, #055-999-151.

An LCS/LCSD were prepared and analyzed for 8081A batch B9F1507 instead of the method specified LCS/MS/MSD. Insufficient sample was received to meet method QC requirements. Recovery for the 8081A surrogate decachlorobiphenyl was below laboratory limits in the sample GP-FB-1(water). All spike compounds and surrogate recoveries in the 8081A batch B9F1507 blank, LCS/LCSD, and MS were acceptable.

Methylene chloride was detected in the 8260 water batch B9F2213 method blank between the MDL and RL. Samples where the methylene chloride result was equal to or less than five times the blank concentration are flagged.

Recoveries for the 8270 SVOC compounds 4-chloro-3-methylphenol, 4-nitrophenol, and phenol in the water batch B9F1702 MS/MSD were below laboratory limits. Recoveries for the surrogates 2-fluorophenol, phenol-d6, and 2,4,6-tribromophenol were below laboratory limits in the MS/MSD. All spike compounds and surrogates were within limits in the batch method blank and LCS. The MS/MSD source sample was not associated with this work order.

Recoveries for most of the compounds in the 8270 SVOC soil batch B9F1801 MS were below laboratory limits. The %RPDs for most of the compounds were outside laboratory limits in the MS/MSD. Recoveries for the surrogates nitrobenzene-d5 in the sample SOC1-SS2B and 2-fluorobiphenyl in the sample SOC1-SS3A were below laboratory limits. Recoveries for the surrogates 2-fluorobiphenyl and 2-fluorophenol in the MS were below laboratory limits. All spike compounds and surrogates were within limits in the batch method blank and LCS/MSD. The MS/MSD source sample was SS5.

Recovery for the 8270 SVOC surrogate 2-fluorophenol in sample SS2 was below the laboratory limit.

Copper, lead and zinc recoveries in the MS/MSD samples and copper and zinc MS/MSD RPDs for 6010 batch B9F1805 were outside laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was not associated with this work order.

Beryllium recoveries in the MS/MSD samples for 6020 batch B9F2412 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was not associated with this work order.

Silver and zinc recoveries in the MS/MSD samples for 6010 batch B9F2413 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was not associated with this work order.

This report was revised on 7/27/09 to correct the ICP metals results for samples SOC1-SS2B, SS-DUP-1, SOC1-SS2A, SOC1-SS2C, SOC1-SS3B, SOC1-SS3C, SOC1-SS3A, SOC1-SS1A, SOC1-SS1B, SOC1-SS1C, SS1, SS2, SS3, SS4, and SS5.

At the client's request, this report was revised on 08/12/09 to include the following narrative. Per Legend's ICP SOP, "for elements of interest, the absolute value of the CCB result must be less than the reporting limit. If not, samples bracketed by an out-of-spec CCB must be re-analyzed." The zinc CCB associated with samples SOC1-SS2B, SS-DUP-1, SOC1-SS2A, SOC1-SS2C, SOC1-SS3B, SOC1-SS3C, SOC1-SS3A, SOC1-SS1A, SOC1-SS1B, SOC1-SS1C and SS1 was equal to the reporting limit at 0.020 mg/L. The samples were not reanalyzed.

Notes and Definitions

W-03	The initial sample weight was less than 8.0 grams.
S-GC	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate(s).
S-02	Surrogate recovery outside of laboratory acceptance limits.
R5	MS/MSD RPD exceeded the laboratory acceptance limit. Recovery met acceptance criteria.
R2	RPD/RSD exceeded the laboratory acceptance limit.
QM-10	LCS/LCSD were analyzed in place of MS/MSD.
Q9	Insufficient sample received to meet method QC requirements.
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
J	Parameter was present between the MDL and RL and should be considered an estimated value
H3b	The trip-blank sample was received and analyzed past holding time.
B-02	Target analyte was present in the method blank between the MDL and RL.
B	Analyte was present in the method blank. Sample result is less than or equal to 5 times the blank concentration.
<	Less than value listed
dry	Sample results reported on a dry weight basis
NA	Not applicable. The %RPD is not calculated from values less than the reporting limit.
MDL	Method Detection Limit
RL	Reporting Limit
RPD	Relative Percent Difference
LCS	Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
MS	Matrix Spike = Laboratory Fortified Matrix (LFM)

RE: 23/19-0B05.07

Enclosed are the results of analyses for samples received by the laboratory on 06/16/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of this report and then discarded unless other arrangements are made.

Case Narrative:

Recoveries for the 8270 SVOC compounds 4-chloro-3-methylphenol, 4-nitrophenol, and phenol in the water batch B9F1702 MS/MSD were below laboratory limits. Recoveries for the surrogates 2-fluorophenol, phenol-d6, and 2,4,6-tribromophenol were below laboratory limits in the MS/MSD. All spike compounds and surrogates were within limits in the batch method blank and LCS. The MS/MSD source sample was not associated with this work order.

Recoveries for most of the 8270 SVOC compounds in the soil batch B9F1801 MS were below laboratory limits. The %RPDs for most of the compounds were outside laboratory limits in the MS/MSD. Recoveries for the surrogates 2-fluorobiphenyl and 2-fluorophenol in the MS were below laboratory limits. All spike compounds and surrogates were within limits in the batch method blank and LCS/MSD. The MS/MSD source sample was not associated with this work order.

Recovery for 4,4'-DDT in the ending 8081A continuing calibration verification standard (CCVS) was above the method limit, however, following calibration evaluation procedures per EPA 8000B, the average % difference for all analytes was within the method limit, verifying the calibration. The specific analytes are flagged as required.

Notes and Definitions

- V7 Calibration verification recovery was above the method control limit for this analyte, however the average % difference or % drift for all the analytes met method criteria.
- S-02 Surrogate recovery outside of laboratory acceptance limits.
- R5 MS/MSD RPD exceeded the laboratory acceptance limit. Recovery met acceptance criteria.
- R2 RPD/RSD exceeded the laboratory acceptance limit.
- M2 Matrix spike recovery was low, the associated blank spike recovery was acceptable.
- J Parameter was present between the MDL and RL and should be considered an estimated value
- < Less than value listed
- dry Sample results reported on a dry weight basis
- NA Not applicable. The %RPD is not calculated from values less than the reporting limit.
- MDL Method Detection Limit
- RL Reporting Limit
- RPD Relative Percent Difference
- LCS Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
- MS Matrix Spike = Laboratory Fortified Matrix (LFM)

ANALYTICAL REPORT FOR SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
WSW-207605	0902894-01	Water	06/18/09 14:10	06/18/09 14:55

Shipping Container Information

Default Cooler Temperature (°C): 2.7

Received on ice: Yes Temperature blank was present Received on ice pack: No
 Received on melt water: No Ambient: No Acceptable (IH/ISO only): No
 Custody seals: No

Case Narrative:

Recovery for 4,4'-DDT in the ending 8081A continuing calibration verification standard (CCVS) was above the method limit, however, following calibration evaluation procedures per EPA 8000B, the average % difference for all analytes was within the method limit, verifying the calibration . The specific analytes are flagged as required.

Recovery for the 8081A surrogate tetrachloro-meta-xylene was slightly below laboratory limits in the batch B9F2206 blank. The remaining surrogate in the blank and all spike compounds and surrogate recoveries in the batch LCS/MS/MSD were acceptable.

Notes and Definitions

V7	Calibration verification recovery was above the method control limit for this analyte, however the average % difference or % drift for all the analytes met method criteria.
S-GC	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate(s).
<	Less than value listed
dry	Sample results reported on a dry weight basis
NA	Not applicable. The %RPD is not calculated from values less than the reporting limit.
MDL	Method Detection Limit
RL	Reporting Limit
RPD	Relative Percent Difference
LCS	Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
MS	Matrix Spike = Laboratory Fortified Matrix (LFM)

Work Order Number: 0903080
RE: 23/19-0B05.07

Enclosed are the results of analyses for samples received by the laboratory on 07/01/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of this report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

RE: 23/19-0B05.07

Enclosed are the results of analyses for samples received by the laboratory on 06/12/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of this report and then discarded unless other arrangements are made.

Shipping Container Information

Default Cooler Temperature (°C): 8.3

Received on ice: Yes Temperature blank was present Received on ice pack: No
 Received on melt water: No Ambient: No Acceptable (IH/ISO only): No
 Custody seals: No

Case Narrative:

This report consists of the ICP-AES reanalyses for samples SS1, SS2, SS3, SS4, and SS5.

Antimony recovery in the MSD sample for batch B9G2905 was below laboratory control limits. Recoveries in the LCS/LCSD/MS samples and the corresponding RPDs were within limits. The MS/MSD source sample was not associated with this work order.

REVISION

Ms. Kelly Neppl
Barr Engineering Co.
4700 W 77th St
Minneapolis, MN 55435

Work Order Number: 0903498
RE: 23/19-0B05.07

This is a revised report. The details of the revision are listed in the case narrative on the following page.

Enclosed are the results of analyses for samples received by the laboratory on 06/10/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of the original report and then discarded unless other arrangements are made.

Custody seals: No		

Case Narrative:

This report includes the reanalysis of the ICP digests for GP-DUP-3, SOC3-GP2, SOC1-GP3, and SOC-GP3 and the reanalysis of the samples for mercury.

This report was revised on August 12, 2009 to include the results for the samples above after they were refiltered then digested and analyzed. Upon reviewing the reanalysis of the samples and noting the results were similar to the previous, the digests were visually compared to see if any differences were seen. It appeared that some of the samples (SOC3-GP2, SOC1-GP3, and SOC-GP3) were cloudy and had more sediment than typically seen with filtered samples. Two possibilities may be sample seeping around the filter if not filtered slowly or filter breakthrough. These samples were set up again at the request of the Barr Client Manager at Legend. The samples were analyzed and reported as samples -05, -06, -07, and -08 respectively.

Notes and Definitions

H1	Sample analysis performed past holding time.
F-01	The sample was filtered in the laboratory prior to analysis.
<	Less than value listed
dry	Sample results reported on a dry weight basis
NA	Not applicable. The %RPD is not calculated from values less than the reporting limit.
MDL	Method Detection Limit
RL	Reporting Limit
RPD	Relative Percent Difference
LCS	Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
MS	Matrix Spike = Laboratory Fortified Matrix (LFM)

Work Order Number: 0904018
RE: 23190B05.07

Enclosed are the results of analyses for samples received by the laboratory on 09/11/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of this report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

Shipping Container Information

Default Cooler Temperature (°C): 5.6

Received on ice: Yes Temperature blank was present Received on ice pack: No
 Received on melt water: No Ambient: No Acceptable (IH/ISO only): No
 Custody seals: Yes

Case Narrative:

MN Certification does not apply to dichlorofluoromethane, tetrahydrofuran, and 1,1,2-trichlorotrifluoroethane in the 8260B analysis or to carbazole in the 8270C analysis.

Beryllium recoveries in the MS/MSD samples for 6020 batch B9I2003 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was not associated with this work order.

Zinc recoveries in the MS/MSD samples for 6010 batch B9I2002 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was SOC4-GP4_1-2.

Notes and Definitions

- M2 Matrix spike recovery was low, the associated blank spike recovery was acceptable.
- J Parameter was present between the MDL and RL and should be considered an estimated value
- H3b The trip-blank sample was received and analyzed past holding time.
- < Less than value listed
- dry Sample results reported on a dry weight basis
- NA Not applicable. The %RPD is not calculated from values less than the reporting limit.
- MDL Method Detection Limit
- RL Reporting Limit
- RPD Relative Percent Difference
- LCS Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
- MS Matrix Spike = Laboratory Fortified Matrix (LFM)

- Notes:**
- M - the values with this notation indicate the limit is for all combined isomers of this compound
 - T - the values with this notation represent the limit for the total carcinogenic PAHs as BaP
 - C - Mercury as mercuric chloride
 - (TA) - Legend Technical Services, Inc. will subcontract this analysis to Test America, West Sacramento, California.
 - (Braun) - Legend Technical Services, Inc. will subcontract this analysis to Braun Intertec, Minneapolis, MN.
 - (1) Not a HRL but a Health Based Value (HBV)
 - (2) (SRL)-Specific Risk Level (water concentration which corresponds to a risk of 1E-5.
 - (3) Not a HRL but an EPA Maximum Contaminant Level (MCL).
 - (4) Value is representative of the lowest exposure duration published in the 2008 Health Risk Limits.
 - (5) Value represents the criteria for Chromium, hexavalent.
 - (6) Set at short-term HRL.
 - (7) Not a HRL, but a Risk Assessment Advice (RAA).
 - (8) Value represents the criteria for Chromium, Trivalent.
 - 1 - Minnesota Department of Health, Health Risk Limit (HRL) unless noted otherwise.
 - 2 - Minnesota Pollution Control Agency's Risk-based guidance for Soil - Soil Leaching Value (SLV)
 - 3 - Minnesota Pollution Control Agency's Risk-based guidance for Soil - Soil Reference Value (SRV)
 - 4 - Minnesota Pollution Control Agency's Risk-based guidance for Soil - Tier II Industrial SRV.

Minneapolis, MN 55435

Work Order Number: 0904032
RE: 23190B05.07

Enclosed are the results of analyses for samples received by the laboratory on 09/14/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of this report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

ANALYTICAL REPORT FOR SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
SOC4-GP2_1-3	0904032-01	Soil	09/11/09 09:15	09/14/09 13:15
SOC4-GP3_1-3	0904032-02	Soil	09/11/09 10:00	09/14/09 13:15
SOC1-GP3R	0904032-03	Water	09/11/09 11:15	09/14/09 13:15

Shipping Container Information

Default Cooler Temperature (°C): 8.7

Received on ice: Yes Temperature blank was present Received on ice pack: No
 Received on melt water: No Ambient: No Acceptable (IH/ISO only): No
 Custody seals: Yes

Case Narrative:

MN Certification does not apply to carbazole in the 8270C analysis.

Beryllium recoveries in the MS/MSD samples for 6020 batch B9I2003 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was not associated with this work order.

Notes and Definitions

- M2 Matrix spike recovery was low, the associated blank spike recovery was acceptable.
- J Parameter was present between the MDL and RL and should be considered an estimated value
- < Less than value listed
- dry Sample results reported on a dry weight basis
- NA Not applicable. The %RPD is not calculated from values less than the reporting limit.
- MDL Method Detection Limit
- RL Reporting Limit
- RPD Relative Percent Difference
- LCS Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
- MS Matrix Spike = Laboratory Fortified Matrix (LFM)

Notes:

- M - the values with this notation indicate the limit is for all combined isomers of this compound
- T - the values with this notation represent the limit for the total carcinogenic PAHs as BaP
- C - Mercury as mercuric chloride
- (TA) - Legend Technical Services, Inc. will subcontract this analysis to Test America, West Sacramento, California.
- (Braun) - Legend Technical Services, Inc. will subcontract this analysis to Braun Intertec, Minneapolis, MN.
- (1) Not a HRL but a Health Based Value (HBV)
- (2) (SRV)-Specific Risk Level (water concentration which corresponds to a risk of 1E-5.
- (3) Not a HRL but an EPA Maximum Contaminant Level (MCL).
- (4) Value is representative of the lowest exposure duration published in the 2008 Health Risk Limits.
- (5) Value represents the criteria for Chromium, hexavalent.
- (6) Set at short-term HRL.
- (7) Not a HRL, but a Risk Assessment Advice (RAA).
- (8) Value represents the criteria for Chromium, Trivalent.
- (9) - Minnesota Department of Health, Health Risk Limit (HRL) unless noted otherwise.
- ¹ - Minnesota Pollution Control Agency's Risk-based guidance for Soil - Soil Leaching Value (SLV)
- ² - Minnesota Pollution Control Agency's Risk-based guidance for Soil - Soil Reference Value (SRV)
- ³ - Minnesota Pollution Control Agency's Risk-based guidance for Soil - Tier I Industrial SRV.
- ⁴ - Minnesota Pollution Control Agency's Risk-based guidance for Soil - Tier II Industrial SRV.

Work Order Number: 0904320
RE: 23190B05.07

Enclosed are the results of analyses for samples received by the laboratory on 10/02/09. If you have any questions concerning this report, please feel free to contact me.

All samples will be retained by LEGEND, unless consumed in the analysis, for 30 days from the date of this report and then discarded unless other arrangements are made.

MDH Certification #027-123-295

Shipping Container Information

Default Cooler Temperature (°C): 4.5

Received on ice: Yes Temperature blank was present Received on ice pack: No
 Received on melt water: No Ambient: No Acceptable (IH/ISO only): No
 Custody seals: No

Case Narrative:

MN Certification does not apply to dichlorofluoromethane, tetrahydrofuran, and 1,1,2-trichlorotrifluoroethane in the 8260B analysis or to carbazole in the 8270C analysis.

Diethyl phthalate was detected in the 8270 water batch B9J0602 method blank between the MDL and RL. It was not detected in the sample. An LCS/LCSD/MS were prepared and analyzed for the batch instead of the method specified LCS/MS/MSD. Insufficient sample was received to meet method QC requirements.

Beryllium recoveries in the MS/MSD samples for the 6020 batch B9J1409 were below laboratory control limits. Recoveries in the LCS/LCSD samples and the corresponding RPDs were within limits. The MS/MSD source sample was sample WSW-207605.

Notes and Definitions

QM-10 LCS/LCSD were analyzed in place of MS/MSD.
Q9 Insufficient sample received to meet method QC requirements.
M2 Matrix spike recovery was low, the associated blank spike recovery was acceptable.
J Parameter was present between the MDL and RL and should be considered an estimated value
B-02 Target analyte was present in the method blank between the MDL and RL.
< Less than value listed
dry Sample results reported on a dry weight basis
NA Not applicable. The %RPD is not calculated from values less than the reporting limit.
MDL Method Detection Limit
RL Reporting Limit
RPD Relative Percent Difference
LCS Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
MS Matrix Spike = Laboratory Fortified Matrix (LFM)

Dear Ms. Nepl,

This report contains the analytical results for the samples received under chain of custody by TestAmerica on June 9, 2009. These samples are associated with your UMore Phase II project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4442.

Sincerely,

Karen M. Sellers
Project Manager

General Comments

Please note that the temperature of the samples was recorded as 13 degrees Celsius at time of receipt. The client was notified and authorized the laboratory to proceed with the analyses.

There are no anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Sample Summary

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

PO/Contract: 23/19-B05.07SOC350

Kelly Nepl
Barr Engineering Company
4700 West 77th Street
Minneapolis, MN 55435-4803

Dear Ms. Nepl,

This report contains the analytical results for the samples received under chain of custody by TestAmerica on June 10, 2009. These samples are associated with your UMore Park project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4442.

Sincerely,

Karen M. Sellers
Project Manager

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Sample Summary

TestAmerica West Sacramento Project Number G9F100247

<u>WO#</u>	<u>Sample #</u>	<u>Client Sample ID</u>	<u>Sampling Date</u>	<u>Received Date</u>
LEM3R	1	SOC1-GP1,0-4	6/8/2009 01:30 PM	6/10/2009 08:55 AM
LEM3W	2	SOC1-GP2,0-4	6/8/2009 02:00 PM	6/10/2009 08:55 AM

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Kelly Nepl
Barr Engineering Company
4700 West 77th Street
Minneapolis, MN 55435-4803

Dear Ms. Nepl,

This report contains the analytical results for the samples received under chain of custody by TestAmerica on June 11, 2009. These samples are associated with your UMore Park project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4442.

Sincerely,

Karen M. Sellers
Project Manager

General Comments

Please note that sample temperature was measured as 7 degrees Celsius (C) at time of receipt. The temperature of the temperature blank was measured as 4 degrees C. The client was notified.

The sample SOC3-TT2-3-4' was labeled as SOC3-TT3-3-4'. The sample container was associated with that on the chain of custody (COC) using the collection time.

WATER, 314.0, Perchlorate

Sample: 8

The noted sample was diluted prior to analysis due to matrix interference. The conductivities of the samples were less than that of the MCT standard indicating that common anions were not high enough to obscure the perchlorate peak. Some other interfering substance(s) in these samples caused very high background and would have obscured the baseline where perchlorate elutes had they been analyzed at 1x. Low level spikes near the RL were prepared for each sample at the dilution it was analyzed at to ensure perchlorate could be detected if present. These spikes are not reported. All samples were ND for the analyte of interest. Reporting limits were adjusted accordingly.

There were no other anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Kelly Nepl
Barr Engineering Company
4700 West 77th Street
Minneapolis, MN 55435-4803

Dear Ms. Nepl,

This report contains the analytical results for the samples received under chain of custody by TestAmerica on June 16, 2009. These samples are associated with your UMore Phase II project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4442.

Sincerely,

Karen M. Sellers
Project Manager

General Comments

Please note that three bottles for nitrocellulose analysis were received for sample MW-E2-009-although the chain of custody indicates one bottle. The client was notified.

The COC indicated that sample FB-1 was on hold. The client authorized the laboratory to proceed with the analysis of perchlorate and nitrocellulose for this sample on June 18, 2009.

WATER, 314.0, Perchlorate

Samples: 1, 2, 3, 4, 5

The above samples were diluted prior to analysis due to matrix interference. The conductivities of the samples were less than that of the MCT standard indicating that common anions were not high enough to obscure the perchlorate peak. Some other interfering substance(s) in these samples caused very high background and would have obscured the baseline where perchlorate elutes had they been analyzed at 1x. Low level spikes near the RL were prepared for each sample at the dilution it was analyzed at to ensure perchlorate could be detected if present. These spikes are not reported. All samples were ND for the analyte of interest. The reporting limits were adjusted accordingly.

There are no other anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Sample Summary

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

TestAmerica Project Number: G9F160229

PO/Contract: 23/19-B05.07SOC350

Kelly Nepl
Barr Engineering Company
4700 West 77th Street
Minneapolis, MN 55435-4803

Dear Ms. Nepl,

This report contains the analytical results for the samples received under chain of custody by TestAmerica on June 16, 2009. These samples are associated with your UMore Phase II project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4442.

Sincerely,

Karen M. Sellers
Project Manager

TestAmerica West Sacramento Project Number G9F160229

WATER, 353.2, Nitrocellulose

Samples: 1, 2

There was insufficient sample volume to prepare a matrix spike/matrix spike duplicate (MS/MSD) pair with this batch.

There are no other anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Sample Summary

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Preparation Data Review Checklist

Prep Batch(es) 9182334

Test: Ncell-L

Prep Date: 7-1-09

Holding Times: 7-9-09 7-13-09 NCM: Y (N)

A. Spike Witness/Batch setup	Spike Witness	Reviewer
1. Holding times checked? NCMs filed as appropriate	✓	✓
2. QAS checked for QC instructions (LCS, LCSD, MS, MSD, etc)	✓	✓
3. Amount of samples in hood match amount of samples on bench sheet. Sample IDS match.	✓	NA
4. Worksheets have been checked for required spiking compounds	*NA	✓
5. Spiking volumes are correctly documented	✓	✓
6. Std ID numbers on spike labels match numbers on bench sheet	✓	NA
7. Expiration dates have been checked	✓	✓
8. Calibration expiration dates on pipettors have been checked	✓	NA
9. Spiker and spike witness have signed and dated bench sheet		✓
B. Weights and Volumes		
1. Recorded weights are in anticipated range	NA	✓
2. Balance upload or raw data for weights is included	NA	✓
3. Weights and volumes have been transcribed correctly to LIMS.	NA	✓
4. Weights are not targeted to meet exact weights.	NA	✓
5. Each weight or volume measurement is a unique record (no dittos or line downs)	NA	✓
C. Standards and Reagents		
1. Lot numbers for all reagents, including clean up stages, are recorded.	NA	✓
2. Are dates and analysts for cleanups recorded?	NA	✓
3. Are correct IDs used for standards? Are expiration dates to day/month/year, when listed?	NA	✓
D. Documentation		
1. Are all nonconformances documented appropriately?	NA	✓
2. QuantIMs entry correct, including dates and times.	NA	✓
3. Are all fields completed?	NA	✓

Kelly Nepl
Barr Engineering Company
4700 West 77th Street
Minneapolis, MN 55435-4803

Dear Ms. Nepl,

This report contains the analytical results for the samples received under chain of custody by TestAmerica on June 17, 2009 and June 18, 2009. These samples are associated with your UMore Phase II project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4442.

Sincerely,

Karen M. Sellers
Project Manager

General Comments

Sample TT-FB-1 was not included in the coolers that arrived on June 17, 2009. The sample was received separately on June 18, 2009. The client was notified on June 17, 2009 and authorized the laboratory to proceed with the analysis of this sample.

A chain of custody (COC) was not included in the shipment received on June 17, 2009. The client was notified and e-mailed the COC to the laboratory.

Please note that sample SOC3-TT6-0-1" was labeled as SOC3-TT6-1-2". The sample was logged in based on the COC ID.

WATER, 353.2, Nitrocellulose

Sample: 6

There was insufficient sample volume to prepare a matrix spike/matrix spike duplicate (MS/MSD) pair with this batch.

There are no other anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Sample Summary

TestAmerica West Sacramento Project Number G9F170221

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.
